Parr offers a broad selection of non-stirred pressure vessels in convenient styles, sizes and pressure ranges for many laboratory uses. Recent additions to this line have included new sizes, new temperature and pressure combinations and new self-sealing closures, all designed to provide convenient vessels for laboratory procedures that must be performed under pressure at elevated temperatures.

**Pressure Vessel Selection Procedure**

The steps to be followed in selecting a non-stirred pressure vessel are similar to those used for a stirred reactor. Selection begins with the Guide to Non-Stirred Vessels, from which the user can identify the Model Number for vessels in a range of sizes with temperature and pressure ratings suitable for the intended application. Detailed specifications and catalog numbers can then be found on the referenced page. After the specifications have been established, the options and accessories required to customize a complete pressure vessel system can be selected.

***Blank Heads***

Many of these non-stirred vessels are offered with a blank head with no drilled holes or fittings. These should be considered only as a starting point for custom built vessels as they do not include a safety rupture disc which good practice, safety codes, and common sense dictate should be installed on all pressure vessels. Users who take delivery of vessels without safety relief devices installed must also take the responsibility for installing adequate protective devices before the vessel is placed in service.
